Department of Computer Engineering and Applications
GLA University, 17 km Stone, NH#2, Mathura-Delhi Road,
P.O. Chaumuhan, Mathura-281406 (U.P.)

Declaration

I hereby declare that the work which is being presented in the M.C.A. Project “**Homemade Food Delivery Management System**”, in partial fulfillment of the requirements for the award of the ***Master of Computer Applications*** and submitted to the Department of Computer Engineering and Applications of GLA University, Mathura, is an authentic record of my own work carried under the supervision of **Mr. Nitesh Bhardwaj (Asst. Professor)**.

The contents of this project report, in full or in parts, have not been submitted to any other Institute or University for the award of any degree.

Certificate

This is to certify that the above statements made by the candidate are correct to the best of my/our knowledge and belief.

Supervisor

(Mr. Nitesh Bhardwaj)

Assistant Professor

Dept. of Computer Engg, & App.

Project Co-ordinator

(Dr. Sachendra Singh Chauhan)

Assistant Professor

Dept. of Computer Engg, & App.

Program Co-ordinator

(Mr. Siddharth Singh)

Assistant Professor

Dept. of Computer Engg, & App.

Date:

ACKNOWLEDGEMENT

The satisfaction accompanying the successful completion of the project is incomplete without mentioning a few names. We take this opportunity to acknowledge the efforts of the many individuals who helped us to make this project possible. Firstly, we would like to express our heartfelt appreciation and gratitude to our project guide **Mr. Nitesh Bhardwaj (Assistant Professor), Computer Engineering & Applications Department**. His vision and execution aimed at creating a structure, definition, and realism around the project and fostered the ideal environment for us to learn and do. Despite his busy schedule, this project results from his teaching, encouragement, and input in the numerous meetings he had with us. The experience was a novel one and we would like to thank all the people, who have lent their valuable time for the completion of the report. Without their consideration, it would have been difficult to complete the report.

ABSTRACT

The rapid growth of the online food delivery industry has largely focused on commercial restaurants, often overlooking the growing consumer demand for authentic, healthy, and hygienic homemade food. To bridge this gap, this project introduces "Mom's Magic," a comprehensive Homemade Food Delivery Management System. The platform serves as a digital bridge connecting talented local home chefs with consumers seeking fresh, home-cooked meals. Developed using web technologies including PHP, MySQL, JavaScript, and AJAX, the system features a robust multi-role architecture comprising Admin, Kitchen Partner, and Customer modules.

Key functionalities include location-based kitchen discovery, an intuitive cart and checkout process integrated with a simulated secure payment gateway (including a virtual 'Magic Wallet'), and an interactive real-time order tracking system utilizing Leaflet.js mapping. Furthermore, the system incorporates a unique "Custom Food Request" (Hybrid Model) feature, allowing customers to communicate specific dietary preferences directly to the chefs. By providing a modern, responsive, and industry-standard user interface, "Mom's Magic" not only delivers a seamless ordering experience for users but also empowers home-based culinary entrepreneurs with a scalable digital storefront to manage their menus, track revenue, and grow their local business.

CHAPTER 1

Introduction

Home-made food delivery services are becoming an increasingly popular solution for individuals seeking healthy, hygienic, and affordable meals. Unlike commercial fast food, home-made meals emphasize freshness, balanced nutrition, and traditional cooking methods. This service connects home chefs with customers who prefer authentic, home-style dishes but may not have the time or skills to cook. It particularly benefits working professionals, students, and elderly people who value both convenience and health. By leveraging mobile applications and online platforms, customers can easily browse menus, place orders, and get meals delivered to their doorstep. Such services also create opportunities for home cooks, especially women and small entrepreneurs, to generate income with minimal investment. Overall, home-made food delivery combines convenience with health-conscious eating, bridging the gap between modern lifestyles and the need for wholesome meals, while simultaneously fostering community connections and supporting local culinary talent.

1.1 Overview and Motivation

Discuss the rise of online food delivery services (e.g., Swiggy, Zomato) and, crucially, the gap for hygienic, healthy, and authentic home-cooked meals. Your motivation should stem from.

1. The demand from consumers (bachelors, working professionals, health-conscious individuals) for non-restaurant food.
2. Empowering home chefs/homemakers to earn an income from their kitchens.

The motivation behind developing the Homemade Food Delivery Management System comes from the growing need for healthy, affordable, and home-prepared food in today's busy lifestyle. Many people, especially students, working professionals, and individuals living away from home, struggle to find hygienic and nutritious meals on a daily basis. At the same time, numerous home chefs

possess excellent cooking skills but lack a proper platform to reach customers.

1.2 Objective

The main objective of the Project on Online Homemade Food Delivery Website is to manage the details of Food item, Category, Cart, Order, Customer. It manages all the information about Food item, Delivery, Customer, Food item. The project is totally built at user, Homemade and administrator end and thus only the administrator is guaranteed the access. The purpose of the project is to build an application program to reduce the manual work for managing the Food item, Category, Delivery, Cart. It tracks all the details about the Cart, Order, Customer.

1.3 Summary of Similar Application

To understand the features and market demand for a Home-Made Food Delivery System, several existing applications and platforms were studied. These platforms offer similar services such as connecting home chefs with customers, delivering homemade meals, and managing online food orders. A brief summary of these applications is given below:

- Several food delivery apps provide features similar to a Home-Made Food Delivery System.
- Swiggy offers support for small and home-based kitchens through Swiggy Access.
- Zomato has experimented with cloud kitchen models that include home-style meals.
- Homefood is a dedicated platform for homemade food prepared by certified home chefs.
- MealTango connects customers with local home cooks offering fresh, authentic meals.
- EatSure collaborates with micro-kitchens and home food providers in select regions.

Chapter 2

Software Requirement Analysis

The Website is a fully automated, web-based food ordering system. Users can access the any browser-enabled device. In this system, two main parties interact with the application.

1. Customer/User – The person who browses the menu, selects food items, places orders, and makes payments.
2. System Administrator (Admin) – The person who manages food categories, menu items, offers, customers, and orders.

2.1 Customer Requirements

- Easy in-Website login and registration system.
- Clear and effective categorization of food items.
- Simple bookmark feature for saving favorite dishes.
- Ability to update food quantity in the cart.
- Displaying a detailed order summary before final confirmation.
- Easy and secure payment options for completing orders.
- Proper validation for all input forms.
- A well-organized admin panel (indirect requirement) to ensure smooth order handling.

2.2 Data Requirement

The system is divided into several modules and functions to provide a clear approach to the solution. The requirements are grouped into **Front End** and **Back End** components.

2.2.1 Front End

The front end is designed for customers who want to browse and order food. To access full features, each customer must create an account.

2.2.2 Back End

The back end manages the core functionality of the system. It handles data processing, storage, and business logic. It includes managing user accounts, food items, orders, and payments. The admin or chef can update menus, check orders, and manage delivery details through the back end. It ensures data security, proper communication between different modules, and smooth operation of the entire system.

2.3 Main Modules

- **Home/Page:** Displays menus, categories, and allows access to other pages.
- **Login:** Registered users can log in to access full ordering features.
- **Sign/Up:** New users can create an account by providing necessary details.
- **Contact Us:** Contains restaurant or support information for customer communication.
- **Cart/Screen:** Displays selected food items. Users can update quantity or remove items.
- **Order Details Screen:** Shows final selected items, quantity, and total bill amount before confirmation.
- **Order Confirmation Screen:** Final step where users confirm their order.
- **Admin Login:** Allows the administrator to log in and manage the entire system. The admin can:
 - Add/update/delete restaurants and food items
 - Manage users and delivery partners
 - Monitor orders and payments
 - Generate reports and analytics

- **Partner Login(Delivery Agent Login):**Delivery partners can log in to view assigned orders, update delivery status, and manage their delivery tasks.
- **Partner With Us:** This section allows new delivery agents or restaurants to register with the platform. Interested partners can fill out a form with necessary details to join the system.

2.4 Feasibility Analysis

Feasibility Analysis is conducted to determine whether the proposed Homemade Food Delivery Management System is practical, achievable, and beneficial. It evaluates the system based on technical, economic, and operational aspects.

2.4.1 Technical Feasibility

Technical feasibility checks whether the required technology, tools, and infrastructure are available to develop and run the system.

- The project uses common web technologies like HTML, CSS, JavaScript, PHP, My SQL, AJAX which are widely available.
- All tools required (editors, browsers, servers) are free or low-cost.
- Hosting can be done easily on cloud platforms such as Hosting, AWS, or Azure. No special hardware or expensive equipment is required.

2.4.2. Economic Feasibility

Economic feasibility evaluates whether the system is cost-effective and worth the investment.

- Development cost is low because open-source tools and technologies are used.
- No need for purchasing high-end hardware or licensed software.
- Hosting charges and maintenance costs are affordable.
- The system can generate revenue through delivery charges, commissions, or subscription plans.
- Reduced operational costs compared to maintaining a physical restaurant.

2.4.3. Operational Feasibility

Operational feasibility determines whether the system will function smoothly and meet user needs.

- The system provides user-friendly interfaces for both customers and admins. Customers can easily browse food, place orders, apply promos, and make payments.
- Admin can manage categories, menu items, customers, and orders efficiently.
- The system automates the entire process, reducing manual errors and improving service quality.
- The solution addresses a real need for homemade food delivery.

2.4.4. Schedule Feasibility

Schedule feasibility evaluates whether the Home-Made Food Delivery System can be completed within the given time frame. It ensures that all project tasks, phases, and deliverables can be achieved according to the project timeline without causing delays. The development of this system is divided into multiple stages such as requirement gathering, analysis, design, coding, testing, and deployment. Each stage is assigned a specific duration based on the complexity of tasks and availability of resources. Due to the use of familiar web technologies and a structured development approach, the system can be completed within the planned schedule. The project does not require any advanced or time-consuming tools, making development faster and more manageable.

2.5. Use Case Descriptions

- **Use Registration & Login**
Users create an account and log in to access the system.
- **Browse Food Items**
Customers view available homemade food, categories, and details.
- **Place an Order**
Users select food items, add them to the cart, and confirm the order.
- **Online Payment**
Customers make payments using available online modes.
- **Track Order**
Users can check real-time status of their order.
- **Admin Management**
Admin manages users, food items, orders, and overall system settings.
- **Chef/Home Cook Management**
Home cooks update menu items, prices, and availability.

2.6 Admin-Side Use Cases

- **Admin Login** : Admin securely logs into the system.
- **Manage Users** : Admin can view, update, block, or delete customer and chef accounts.
- **Manage Food Items** : Admin can add, edit, or remove food items listed by home cooks.
- **Manage Orders** : Admin monitors all orders, updates order status, and resolves issues.
- **Manage Home Cooks/Chefs** : Admin verifies and approves home cook registrations.
- **Handle Complaints/Feedback** : Admin reviews and resolves customer or cook feedback.
- **System Configuration** : Admin updates settings like delivery charges, available categories, etc

2.7 Flow Chart

A flow chart is a graphical or symbolic representation of process. The flow chart symbols are linked together with arrows showing the process flow direction.

Fig.1 Flow Chart for User

Fig.2 Flow Chart for Admin

2.8 Use Case diagram

A use case diagram in the Unified Modeling Language (UML) is a type of behavioral diagram defined by and created from a Use-case analysis. The main purpose of a use case diagram is to show what system functions are performed for which actor.

Fig.3 Use Case Diagram for User

Fig.4 Use Case Diagram for online Register Customer

Fig.5 Use Case Diagram for Admin

Chapter 3

Software Design

Below is a clear, well-organized Software Design section for your **Home-Made Food Delivery System** Website. You can paste this directly into your report (Chapter — Software Design). It covers architecture, modules, database schema, UML summaries, UI layout, sequence flows, and non-functional design considerations.

3.1 Data Flow Diagrams

The Level 0 Data Flow Diagram (DFD) of the Home-Made Food Delivery System provides a high-level overview of the system's interaction with external entities. The main entities include Customers, Admin, and the Payment Gateway. Customers interact with the system by registering or logging in, browsing food items, placing orders, providing delivery details, and making payments. The system responds by providing menu information, order confirmation, status updates, and payment receipts. The Admin interacts with the system to manage food items, categories, promotional offers, and to monitor or process orders, while the system provides reports and order details back to the Admin. Additionally, the system communicates with the Payment Gateway to handle online payments, sending payment requests and receiving confirmations. This diagram represents the entire system as a single process and illustrates the flow of information between the system and external entities, giving a clear overview of its functionality.

Fig.6 DFD Level 0

3.2 Data Flow Diagram (DFD)

Data flow diagrams are highly essential for requirement specification of the system. Data flow diagrams are an intuitive way of showing how data is processed by a system. Those are used to show how data flows through a sequence of processing steps. The data is transformed at each step or transformations are program functions when data flow diagrams are used to documents a system.

3.2.2 Level 1 DFD

For processing the order, process 1.0 is responsible. For food, the housekeeping activities involved are represented by processes 2.0, 3.0, and 4.0. The detailed information about daily sold items should be available to create and report management and the list of items that are available ‘_in-stock’ should be kept by maintaining the inventory data (describes the records of datasets such as their name, their content, source, many useful information, etc.) at the same time. Hence, two data stores are used in this level of DFD given below

- Database of Sold items
- Inventory database

Fig.7 DFD Level 1

Database design is the process of producing a detailed data model of a database. This logical data model contains all the needed logical and physical design choices and physical storage parameters needed to generate a design in a Data Definition Language, which can then be used to create a database. A fully attributed data model contains detailed attributes for each entity. The term database design can be used to describe many different parts of the design of an overall database system.

3.4 E-R Diagram

In software engineering, an entity-relationship model (ER model for short) is an 12 abstract and conceptual representation of data. Entity-relationship modeling is a database modeling method, used to produce a type of conceptual schema or semantic data model of a system, often a relational database, and its requirements in a top-down fashion. Diagrams created by this process are called entity-relationship diagrams, ER0 diagrams.

Fig.8 E-R Diagram

Entities:

User: Represents individuals who use the food delivery application. Attributes may include UserID (Primary Key), Name, Email, Password, Phone Number, and Address.

Restaurant: Represents the restaurants available on the platform. Attributes may include KitchenID (Primary Key), Name, Cuisine Type, Address, Contact Number, and Rating.

Menu Item: Represents the individual food items offered by restaurants. Attributes may include MenuItemID (Primary Key), Name, Description, Price, and KitchenID (Foreign Key).

Order: Represents the orders placed by users. Attributes may include OrderID (Primary Key), UserID (Foreign Key), OrderDate, DeliveryAddress, TotalAmount, and OrderStatus.

Delivery Driver: Represents the individuals responsible for delivering orders. Attributes may include DriverID (Primary Key), Name, Contact Number, and Availability.

Relationships:

User-Order Relationship: One-to-Many relationship between User and Order. One user can place multiple orders, but each order belongs to one user.

Restaurant-Menu Item Relationship: One-to-Many relationship between Restaurant and Menu Item. One restaurant can offer multiple menu items, but each menu item belongs to one restaurant.

User-Review Relationship: One-to-Many relationship between User and Review. One user can provide multiple reviews, but each review is provided by one user.

Order-Menu Item Relationship: Many-to-Many relationship between Order and Menu Item. An order can contain multiple menu items, and a menu item can be part of multiple orders. This relationship is represented by an associative entity or junction table.

Order-Delivery Driver Relationship: Many-to-One relationship between Order and Delivery Driver. Multiple orders can be assigned to the same delivery driver, but each order is assigned to one delivery driver.

3.5 UML Diagrams

3.5.1 Class Diagram : A home-made food delivery system class diagram shows how different parts of the system are organized and connected. The main class is **User**, which is extended by **Customer** and **Chef**. The customer can browse food, add items to a cart, and place orders, while the chef manages food items. Each food item is represented by the **Food Item** class with details like name, price, and availability. The **Cart** holds selected items before ordering, and once confirmed, an **Order** is created with its status and details.

Each order is linked to a **Payment** for transaction processing and a **Delivery** for handling the delivery process. A customer has one cart and can place multiple orders, while a chef can manage many food items. Both cart and order can contain multiple food items. This diagram gives a simple structure of how ordering, payment, and delivery work together in the system.

Fig.9 UML Diagrams Class Diagram

3.5.2.Object Diagram: represents a snapshot of the Food Delivery Management System at a particular point in time. It shows real-world instances (objects) of classes and the relationships between them. Unlike the class diagram, which defines the structure, the object diagram focuses on actual data and interactions occurring in the system.

In this system, several objects are created to represent different entities involved in the food ordering and delivery process. These include **Customer**, **Order**, **Food Item**, **Menu**, **Payment**, **Delivery**, and **Delivery Agent**.

Fig.10 UML Object Diagram

Chapter4

Implementation and User Interface

The implementation phase focuses on converting the design and requirements into a working system. This phase includes setting up the development environment, coding the application, creating the database, integrating front-end and back-end, and testing the system. The user interface (UI) is designed to be intuitive, responsive, and user-friendly for both customers and administrators.

4.1 Implementation Overview

- **Development Tools and Environment**
- **Frontend:** HTML5, CSS, JavaScript, AJAX
- **Backend:** PHP
- **Database:** MYSQL
- **Server :** Xampp

4.2. Implementation Steps

- Database setup with required tables, keys, and stored procedures
- Backend API development for user management, orders, payments, and admin functionalities
- Frontend UI development with responsive design for desktop and mobile
- Integration of payment gateway (UPI, Card, or COD)
- Testing and bug fixing

4.3. Coding Standards

- Proper indentation and comments for readability
- Modular and reusable code structure
- Input validation both client-side and server-side

4.4 User Interface Design

The user interface is designed for easy navigation, quick access to food items, and efficient order processing. It includes different screens for Customers, Admin, and Home Cooks.

4.4.1 Customer Interface

- **Home Page:** Displays categories, popular items, search bar, and featured chefs.
- **Menu Page:** Shows food items with images, descriptions, prices, and —Add to Cartll option.
- **Cart Page:** Shows selected items with quantity update, remove item, total amount, and checkout button.
- **Checkout Page:** Collects delivery address, applies promo codes, and processes payment.
- **Order Confirmation:** Shows order summary, estimated delivery time, and status updates.
- **Bookmark Page:** Customers can save favorite items for quick access

4.4.2.Admin Interface.

- **Login Page:** Secure login for admin users.
- **Dashboard:** Overview of orders, sales statistics, active users, and pending tasks.
- **Manage Categories:** Add, edit, or delete food categories.
- **Manage Menu:** Add, edit, or remove food items.
- **Manage Orders:** View all customer orders and update status.
- **Manage Promos:** Create and update promotional offers.
- **Reports:** Sales, customer activity, and chef performance reports.

4.2.3 Home Cook Interface

Profile Page: Displays chef information and rating.

Menu Management: Add or update available food items.

Order Management: View and accept/reject orders.

Chapter 5

Software Testing

5.1 White Box Testing:

In this technique, the close examination of the logical parts through the software are tested by cases that exercise species sets of conditions or loops. all logical parts of the software checked once. errors that can be corrected using this technique are typographical errors ,logical expressions which should be executed once may be getting executed more than once and error resulting by using wrong controls and loops. When the box testing tests all the independent part within a module a logical decisions on their true and the false side are exercised , all loops and bounds within their operational bounds were exercised and internal data structure to ensure their validity were exercised once.

5.2 Black Box Testing:

This method enables the software engineer to device sets of input techniques that fully exercise all functional requirements for a program. black box testing tests the input, the output and the external data. it checks whether the input data is correct and whether we are getting the desired output.

CHAPTER 6

Snapshots

Home Page:

present the user interface of the Mom's Magic Homemade Food Delivery Management System. The homepage is designed with a clean and attractive layout that includes options such as Sign In and Cart, along with a prominent banner displaying the system title. Users can easily enter their delivery location and search for food items or kitchens using the search bar provided. Below the banner, the platform highlights various offers like Food Delivery and Done, along with different food categories to help users quickly explore available options. The next section displays kitchens offering homemade food, such as Ram's Kitchen, Braj Ki Rasoi, and Radha Ki Kitchen, each showing ratings, estimated delivery time, cuisine type, and location, enabling users to compare and choose suitable options. At the bottom, the footer section provides company details, contact information, and legal links such as Terms & Conditions and Privacy Policy. Overall, these snapshots demonstrate a user-friendly, organized, and efficient interface that enhances the online food ordering experience.

Admin Login Page:

A screenshot of the Admin Login page. At the top left is a close button (X). The title 'Admin Login' is centered. To the right is a circular logo featuring a burrito. Below the title, the text 'Enter your admin phone number' is displayed in orange. A horizontal line is positioned below this text. There are two input fields: the first is labeled 'Name (Required only if new user)' and the second is labeled 'Phone Number'. Below these fields is a large orange button with the text 'CONTINUE' in white. At the bottom, a line of text reads: 'By clicking on Login, I accept the Terms & Conditions & Privacy Policy'.

Step 1: Open Login Page

Admin opens the login interface where two sections are visible: Login and OTP Verification.

Step 2: Enter User Details

Admin enters:

Name (only for new users)

Phone Number

Step 3: Click on Continue

After entering details, user clicks on the Continue button to proceed.

Step 4: Receive OTP

System sends a 4-digit OTP (One-Time Password) to the entered mobile number.

Admin Login Verify OTP Page:

The image shows a mobile app screen for verifying an OTP. At the top, the title "Verify Your Number" is displayed in bold. Below it, a message states "We've sent a 4-digit OTP to" followed by the phone number "+91 9528467639". A green dashed box contains a key icon and the text "DEMO MODE OTP: 7378". Below this is a white input box with an orange border containing four "X" characters. An orange button labeled "VERIFY & LOGIN" is positioned below the input box. At the bottom, there is a link that says "← Cancel and go back".

Step 5: Enter OTP

User types the received OTP in the verification input box.

Step 6: Verify & Login

Admin clicks on Verify & Login button.

Step 7: Successful Authentication

If OTP is correct, the user is successfully logged into the system.

If incorrect, user must re-enter the correct OTP.

Step 8: Cancel Option (Optional)

Admin can click Cancel and go back if they want to exit the process.

Admin Control Panel Page:

The Admin Control Panel Page acts as the central management system for the Home Made Food Delivery System. After logging in, the admin is presented with a dashboard that displays key statistics such as total users, total kitchens, total orders, and total revenue. From this panel, the admin can efficiently manage all operations through different modules. The “Manage Users” option allows viewing, updating, or removing customer accounts, while “Add Some Kitchen” enables the addition of new home-based cooks to the platform. Through “Manage Kitchens,” the admin can monitor and control registered kitchens. The “Manage Food Options” section is used to add, edit, or delete food items available for customers. Additionally, the “Add Menu Item” and “Manage Menu Items” features help organize and update the food menu. The “Manage Orders” section allows tracking, updating, and handling customer orders. Overall, this control panel ensures smooth operation, proper monitoring, and effective management of the entire food delivery system.

User Login Page:

A screenshot of a mobile application's login and sign-up page. At the top, there is a close button (X) and the text "Login / Sign up" with a user icon. Below this, it says "or create an account". There are two input fields: the first contains the name "Veer" and the second contains the phone number "7302854570". Below the input fields is a large orange button labeled "CONTINUE". At the bottom, there is a small text line: "By clicking on Login, I accept the Terms & Conditions & Privacy Policy".

Step 1: Open Login/Sign Up Page

User opens the login interface where two sections are visible: Login/Sign Up and OTP Verification.

Step 2: Enter User Details

User enters:

Name (only for new users)

Phone Number

Step 3: Click on Continue

After entering details, user clicks on the Continue button to proceed.

Step 4: Receive OTP

System sends a 4-digit OTP (One-Time Password) to the entered mobile number

User Login Verify OTP Page:

The image shows a mobile app screen for verifying a 4-digit OTP. At the top, the title "Verify Your Number" is displayed in bold. Below it, a message states "We've sent a 4-digit OTP to +91 7302854570". A green dashed box contains a key icon and the text "DEMO MODE OTP: 4734". Below this is an input field with the digits "4 7 3 4" and a cursor. An orange button labeled "VERIFY & LOGIN" is positioned below the input field. At the bottom, there is a link that says "← Cancel and go back".

Step 5: Enter OTP

User types the received OTP in the verification input box.

Step 6: Verify & Login

User clicks on Verify & Login button.

Step 7: Successful Authentication

If OTP is correct, the user is successfully logged into the system.

If incorrect, user must re-enter the correct OTP.

Step 8: Cancel Option (Optional)

User can click Cancel and go back if they want to exit the process.

Partner Login Page:

A screenshot of a mobile application's Partner Login page. At the top left is a close button (X). The title 'Partner Login' is in bold black text. Below it is a cartoon character icon of a person with a white headband. To the right is a circular image of a burrito. The text 'Enter your registered phone number' is in orange. Below this is a text input field containing 'Aman Khushwa'. Underneath is another text input field containing '7505187234'. At the bottom is a large orange button with the word 'CONTINUE' in white. Below the button is a small text line: 'By clicking on Login, I accept the Terms & Conditions & Privacy Policy'.

Step 1: Open Login/Sign Up Page

Partner opens the login interface where two sections are visible: Login and OTP Verification.

Step 2: Enter User Details

Partner enters:

Name (only for new users)

Phone Number

Step 3: Click on Continue

After entering details, user clicks on the Continue button to proceed.

Step 4: Receive OTP

System sends a 4-digit OTP (One-Time Password) to the entered mobile number

Partner Login Verify Page:

The image shows a mobile app interface for verifying a phone number. At the top, the title "Verify Your Number" is displayed in a bold, dark font. Below the title, a message states "We've sent a 4-digit OTP to" followed by the phone number "+91 7505187234" in a bold, dark font. A green dashed box contains a key icon and the text "DEMO MODE OTP: 8177". Below this, a white input box with an orange border contains the digits "8 1 7 7". An orange button with the text "VERIFY & LOGIN" is positioned below the input box. At the bottom, there is a link that says "← Cancel and go back" in a smaller, orange font.

Step 5: Enter OTP

Partner types the received OTP in the verification input box.

Step 6: Verify & Login

Partner clicks on Verify & Login button.

Step 7: Successful Authentication

If OTP is correct, the user is successfully logged into the system.

If incorrect, user must re-enter the correct OTP.

Step 8: Cancel Option (Optional)

User can click Cancel and go back if they want to exit the process.

Kitchen UI

Menu Item

The screenshot shows the 'Manage Menu Items' page. It features a table with columns: IMAGE, NAME, TYPE, PRICE, STATUS, and ACTION. There are four menu items listed: Pasta, Noodles, South Indian, and Paratha. Each item has a status of 'Available' and action buttons for 'Edit' and 'Delete'. An '+ Add New Item' button is located in the top right corner.

IMAGE	NAME	TYPE	PRICE	STATUS	ACTION
	Pasta	Veg	\$57.00	Available	Edit Delete
	Noodles	Veg	\$543.00	Available	Edit Delete
	South Indian	Veg	\$150.00	Available	Edit Delete
	Paratha	Veg	\$25.00	Available	Edit Delete

Kitchen Details

The screenshot shows the 'Edit Profile' page with a 'Kitchen Details' form. The form includes fields for 'Kitchen Name' (filled with 'Ram's Kitchen'), 'About (Description)' (filled with 'Best HomeMade Food'), 'Address' (filled with '88-88, Chhodikara, Chhatis, Mathura, Uttar Pradesh, 201402, India'), and 'City' (filled with 'Mathura'). There is an 'Auto Locate' button next to the address field. At the top right, there is a '+ Back to Dashboard' link.

CHAPTER 7

Conclusion

The Homemade Food Delivery Management System provides an efficient and user-friendly solution for managing online food ordering and delivery services. It successfully integrates customers, restaurants, admin, and delivery partners into a single platform, ensuring smooth communication and coordination. The system simplifies the entire process—from browsing menus and placing orders to payment and delivery tracking—thereby reducing manual effort and saving time. With features like real-time order updates, secure data management, and an organized module structure, the system enhances accuracy and reliability. Additionally, modules such as admin control and kitchen management improve operational efficiency and help in handling orders effectively. Overall, this project demonstrates how modern technology can transform traditional food delivery methods into a faster, more reliable, and scalable system, with scope for future enhancements like AI recommendations and advanced tracking systems.

CHAPTER 8

Summary

The Homemade Food Delivery Management System is a web-based application developed to simplify the process of ordering food online and managing delivery operations efficiently. The system connects customers, restaurants, and delivery agents on a single platform, ensuring a smooth and fast service experience.

The main objective of this project is to provide users with an easy-to-use interface where they can browse menus, place orders, make payments, and track deliveries in real time. At the same time, it helps restaurant owners manage their menu, orders, and customer data effectively.

The system is divided into multiple modules, including Customer Module, Admin Module, Restaurant Module, and Delivery Module. Each module performs specific functions such as user authentication, order processing, payment handling, and delivery tracking. The front-end is designed to be user-friendly, while the back-end ensures secure data processing and system functionality.

The database plays a crucial role by storing user details, order history, restaurant information, and transaction records. Proper database management ensures data accuracy, consistency, and quick retrieval.

Overall, this project demonstrates how technology can improve traditional food ordering systems by making them faster, more reliable, and user-centric. The system is scalable and can be further enhanced with features like real-time GPS tracking, AI-based recommendations, and multiple payment integrations.
